This invention relates to a novel apparatus for detecting a microbe in a sample which comprises a substrate having multiple microbe identification of that microbe identification sites, each having a unique address indicative of the position of that microbe identification sites of the position of that corposed at the microbe identification sites, each group being probes disposed at the microbe identification sites, each group being complementary to a target nucleic acid to provide a detectable signal at one or more microbe identification sites. The apparatus is useful for cone or more microbes in a sample, such as virus or viral particle, (non-)pathogenic bacteria, or cellular or acellular microbe. The apparatus is particularly useful for clinical diagnosis, research, epidemiological surveilance, bioterrorism countermeasures, creting procedures or devices, such as radioimmunosassays and ELISA, are difficult to implement, time consuming, expensive, outdated, and creating procedures or devices, such as radioimmunosassays and ELISA, are difficult to implement, time consuming, expensive, outdated, and bound proteins or carbohydrates of the pathogen. These further cannot assay multiple pathogens. The new apparatus or device for detecting microbes overcomes these disadvantages. The apparatus is compact, sensitive, and quick to detect the present equence is that of an under of a number of pathogens present in a sample. The present sequence is that of an opporatus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel microbe detection apparatus-related oligonucleotide probe SeqID26.
                 New (microarray) apparatus comprising a substrate with attached nucleic acid probes, useful for detecting one or more microbes in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New (microarray) apparatus comprising a substrate with attached nucleic

This invention relates to a novel apparatus for detecting a microbe in a

Claim 16; SEQ ID NO 9; 89pp; English.

```
This invention relates to a novel apparatus for detecting a microbe in a sample which comprises a substrate having multiple microbe identification altes, each having a unique address indicative of the position of that microbe identification site on the substrate and groups of nucleic acid probes disposed at the microbe identification sites, each group being complementary to a target nucleic acid to provide a detectable signal at one or more microbe identification sites. The apparatus is useful for detecting the presence of one or more microbes in a sample, such as virus or viral particle, (non-)pathogenic bacteria, or cellular or acellular microbe. The apparatus is particularly useful for clinical diagnosis, research, epidemiological surveys, and monitoring food contaminants. Current testing procedures or devices, such as radioimmnossasys and ELISA, are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             oligonucleotide probe which is related to the micorbe detection apparatus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  difficult to implement, time consuming, expensive, outdated, and typically rely on the use of agents that recognise and bind to membrane bound proteins or carbohydrates of the pathogen. These further cannot assay multiple pathogens. The new apparatus or device for detecting
acid probes, useful for detecting one or more microbes in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sensitive, and quick to detect the presence of any of a number of pathogens present in a sample. The present sequence is that of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     microbes overcomes these disadvantages. The apparatus is compact,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 70 BP; 11 A; 21 C; 21 G; 17 T; 0 U; 0 Other;

Tilles JG; 23-MAY-2003; 2003WO-US016461 15-NOV-2002; 2002US-00295787 (REGC ) UNIV CALIFORNIA. Berger MA, Jia XY,

New (microarray) apparatus comprising a substrate with attached nucleic acid probes, useful for detecting one or more microbes in a sample. WPI; 2004-449626/42

```
sample which comprises a substrate having multiple microbe identification sites, each having a unique address indicative of the position of that microbe identification site on the substrate and groups of nucleic acid probes disposed at the microbe identification sites, each group being complementary to a target nucleic acid to provide a detectable signal at one or more microbe identification sites. The apparatus is useful for detecting the presence of one or more microbes in a sample, such as virus or viral particle, (non-)pathogenic bacteria, or cellular or acellular convirumental pathogen surveyly useful for clinical diagnosis, research, epidemiological surveillance, bioterrorism countermeasures, environmental pathogen surveys, and monitoring food contaminants. Current testing procedures or devices, such as radioimmunosassys and ELISA, are difficult to implement, time consuming, expensive, outdated, and typically rely on the use of agents that recognise and bind to membrane bound proteins or carbohydrates of the pathogen. These further cannot

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    oligonucleotide probe which is related to the micorbe detection apparatus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel microbe detection apparatus-related oligonucleotide probe SeqID12.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New (microarray) apparatus comprising a substrate with attached nucleic acid probes, useful for detecting one or more microbes in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                            assay multiple pathogens. The new apparatus or device for detecting microbes overcomes these disadvanteses. The apparatus is compact, sensitive, and quick to detect the presence of any of a number of pathogens present in a sample. The present sequence is that of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          microbe detection; microbe identification; virus; viral particle;

New (microarray) apparatus comprising a substrate with attached nucleic acid probes, useful for detecting one or more microbes in a sample.

Claim 16; SEQ ID NO 22; 89pp; English.

This invention relates to a novel apparatus for detecting a microbe in a sample which comprises a substrate having multiple microbe identification

microbe identification site on the substrate and groups of nucleic acid probe identification sites, each group soft nucleic acid probes disposed at the microbe identification sites, each group being complementary to a target nucleic acid to provide a detectable signal at one or more microbe identification sites. The apparatus is useful for detecting the presence of one or more microbes in a sample, such as virus or viral particle, (non-)pathogenic bacteria, or cellular or acillular microbe. The apparatus is particularly useful for clinical diagnosis, research, epidemiological surveillance, bioterrorism countermeasures, research, epidemiological surveillance, bioterrorism countermeasures, centing procedures or devices, and monitoring food contaminants. Current testing procedures or devices, and monitoring food contaminants. Current testing procedures or devices, such as radioimmunoassays and Elisa, are typically rely on the use of agents that recognise and bind to membrane bound proteins or carbohydrates of the pathogen. These further cannot assert and the consumination of the pathogen. These further cannot assert and the consumination of the pathogen. These further cannot assert and the consumination of the pathogen. oligonucleotide probe which is related to the micorbe detection apparatus of the invention. microbes overcomes these disadvantages. The apparatus is compact, sensitive, and quick to detect the presence of any of a number of pathogens present in a sample. The present sequence is that of an

New (microarray) apparatus comprising a substrate with attached nucleic acid probes, useful for detecting one or more microbes in a sample. Claim 16; SEQ ID NO 8; 89pp; English.

This invention relates to a novel apparatus for detecting a microbe in a sample which comprises a substrate having multiple microbe identification sites, each having a unique address indicative of the position of that microbe identification site on the substrate and groups of nucleic acid probes disposed at the microbe identification sites, each group being complementary to a target nucleic acid to provide a detectable signal at

one or more microbe identification sites. The apparatus is useful for detecting the presence of one or more microbes in a sample, such as virus or viral particle, (non-)pathogenic bacteria, or cellular or acellular microbe. The apparatus is particularly useful for clinical diagnosis, research, epidemiological surveillance, bioterrorism countermeasures, critical pathogen surveys, and monitoring food contaminants. Current testing procedures or devices; such as radioimmunosasays and ELISA, are difficult to implement, time consuming, expensive, outdated, and crypically rely on the use of agents that recognise and bind to membrane bound proteins or carbohydrates of the pathogen. These further cannot assay multiple pathogens. The new apparatus or device for detecting microbes overcomes these disadvantages. The apparatus is compact, sensitive, and quick to detect the present esquence is that of an unber of pathogens present in a sample. The present sequence is that of an original pathogen which is related to the micorbe detection apparatus ö Gaps ô 100.0%; Score 25; DB 12; Length 70; 100.0%; Pred. research, epidemiological surveillance, bioterrorism countermeasures, environmental pathogen surveys, and monitoring food contaminants. Current testing procedures or devices, such as radioimmunoassays and ELISA, are difficult to implement, time consuming, expensive, outdated, and typically rely on the use of agents that recognise and bind to membrane bound proteins or carbohydrates of the pathogen. These further cannot assay multiple pathogens. The new apparatus or device for detecting microbes overcomes these disadvantages. The apparatus is compact, pathogens present in a sample. The present equence is that of an oligonucleotide probe which is related to the microbe detection apparatus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56762 to ABB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and (K1) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                          Gaps

This invention relates to a novel apparatus for detecting a microbe in a sample which comprises a substrate having multiple microbe identification sites, each having a unique address indicative of the position of that microbe identification site on the substrate and groups of nucleic acid microbe identification sites on the substrate and groups of nucleic acid sorbes adsposed at the microbe identification sites, each group being complementary to a target nucleic acid to provide a detectable signal at one or more microbe identification sites. The apparatus is useful for detecting the presence of one or more microbes in a sample, such as virus or viral particle, (non-)pathogenic bacteria, or callular or acidlular microbe. The apparatus is particularly useful for clinical diagnosis,

New (microarray) apparatus comprising a substrate with attached nucleic acid probes, useful for detecting one or more microbes in a sample.

The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56762 to ABB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (XI) comprising (II), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB5671 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (XI) are useful for detecting enterovirus target sequence. (I) section; and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The
                                                                                                                                                               ö
genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     untranslated polynucleotide

The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56762 to ABB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (MI) are useful for detecting enterovirus target sequences: (I), (MI) and (MI) are sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          present sequence represents a viral 5' untranslated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequence given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    100.0%; Score 25; DB 14; Length 126; 100.0%; Pred. The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABS5672 to ABS5671; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABS56764 to ABS56771 and optionally a sequence required for selected amplification reaction; and (D) detecting the amplified target sequence. (I), (MI) and (XI) are useful for detecting enterovirus target sequence. (I) specifically and rapidly detects fewer than 500 copies of enteroviral sensitively and rapidly detects fewer than 500 copies of enteroviral speneme and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polymucleotide squence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                          Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              100.0%; Score 25; DB 14; Length 198; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an oligonucleotide (1) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABBS6712 to ABBS6713, and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS6764 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting enterovirus target sequence. (1), (M1) and (K1) are useful for detecting enterovirus target sequences. (1) specifically and selectively recognizes the enterovirus genome. (1) specifically and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5, untranslated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         8
                                                                                                                                                                                                                                                                     The invention relates to an oligomucleotide (I) consisting of: (a) the target binding sequence of an oligomucleotide chosen from any one of the C sequence of ABBS672 to ABBS671; and (b) a sequence required for selected amplification or detection. Also described: (I) a kit (XI) comprising (I), and one or more container that contains (I), and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS6764 or obsisting essentially of target binding sequence of any one of ABBS6764 or obsisting essentially of target binding sequence (I), (MI) and (KI) are useful for detecting enterovirus target sequence. (I) specifically and selectively recognizes the enterovirus genome. (I) specifically and selectively recognizes the enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Novel oligonucleotide comprising sequences for binding and amplifying or

GENBANK; AF114383

```
The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABBS671; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS6764 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I) (MI) and (XI) are useful for detecting enterovirus target sequence. (I) specifically and selectively recognizes the enterovirus genome. (I) specifically and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polymucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of AEB567762 to AEB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (K1) comprising (I), and one or more container that contains (I); and (2)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           US2005158710-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            3ENBANK; X92886
```

```
ö
                   the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplifier arget sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequences. (I) sepcifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56771; and (b) a sequence required for sequence contains (1), and one or more contains that contains (1); and one or more contains that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving; (a) amplifying the target sequence using first amplification primer having a sequence onsisting essentially of target binding sequence of any one of ABB5676 to ABB56771 and optionally a sequence required for selected amplification reaction, and (b) detecting the amplification sequence. (I) (M1) and (M1) are useful for detecting enterovirus target sequence. (I) sensitively and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide.
(a) amplifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an oligonucleotide (I) consisting of: (a) the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56762 to ABB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequences: (I), (MI) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           specifically and selectively recognizes the enterovirus genome. (1) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes.
                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  present sequence represents a viral 5' untranslated polynucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                      Human coxsackievirus B3 5' untranslated polynucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

```
The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56762 to ABB5671; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 consisting optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (MI) are useful for detecting enterovirus target sequences. (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         untranslated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sequence given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DB 14; Length 238;

target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56762 to ABB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (l) a kit (K1) comprising (l), and one or more container that contains (l); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (l), (M1) and (K1) are useful for detecting enterovirus target sequence. (l), (M1) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ange of enterovirus serotypes. The untranslated polynucleotide
                                                                                                                                           Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                  consisting of: (a) the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human coxsackievirus B4 5' untranslated polynucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               recognizes the enterovirus genome.

The invention relates to an oligonuclectide (I) consisting of: (a) the target binding sequence of an oligonuclectide chosen from any one of the target binding sequence of ABB56771; and (b) a sequence requirated for selected amplification or detection reaction. Also described: (l) a kit (K1) comprising (I), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and (K1) are useful for detecting the amplified target sequence. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral sensitively and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polymuclectide sequence in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                         Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          100.0%; Score 25; DB 14; Length 238; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABBS6782 to ABBS671; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (K1) comprising (I), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS6764 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and (X1) are useful for detecting enterovirus target sequences. (I), (M1) and specifically and selectively recognizes the enterovirus genome. (I) specifically and rapidly detects fewer than 500 copies of enteroviral sensitively and rapidly detects fewer than 500 copies of enteroviral present sequence represents a viral 5 untranslated polymucleotide specifical the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                            Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

```
target binding sequence of an objoint learning of the carget binding sequence of ABB5672 to ABB5671; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (X1) comprising (II), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB5674 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and (X1) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral sensitively and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5 untranslated polymucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56762 to ABB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (K1) comprising (I), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            amplifying or acids.

The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the consisting of ABBS6762 to ABBS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (I), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS6764 to ABBS6771 and optionally a sequence required for selected amplification reaction, and (b) detecting the amplified target sequence. (I), (M1) and (K1) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I) specifically and rapidly detects fewer than 500 copies of enteroviral contains and contains and contains a single sequences. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral contains and contains a supercovirus services.

                                                    a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an oligonucleotide (1) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the consequence of ABBS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS6764 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (M1) and (K1) are useful for detecting enterovirus target sequences. (1) specifically and selectively recognizes the enterovirus genome. (1) specifically and rapidly detects fewer than 500 copies of enteroviral sensitively and rapidly detects fewer than 500 copies of enteroviral present sequence represents a viral 5 untranslated polymucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The invention relates to an oligomucleotide (I) consisting of: (a) the target binding sequence of an oligomucleotide chosen from any one of the core target binding sequence of an oligomucleotide chosen from any one of the core degrated for a sequence required for selected amplification or detection reaction. Also described: (1) a kit comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB5676 to ABB56771 and optionally a sequence required for selected amplification consisting essentially of target binding sequence. (I), (MI) and (XI) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 50 copies of enteroviral common and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô
Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56762 to ABB5671; and (b) a sequence required for selected amplification or detection. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequences. (I), (MI) and
                                                                                                                                                                                                                                                                Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. Present sequence represents a viral 5' untranslated polymuclectide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    100.0%; Score 25; DB 14; Length 238; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the consisting of ABB56762 to ABB56771; and (b) a sequence required for consequence amplification or detection reaction. Also described: (I) a kit (KI) comprising (II), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequence. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral consistively and rapidly detects fewer than 500 copies of enteroviral consisting and consisting a seriotypes. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                 8
                                                                                    The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56762 to ABB56771, and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (K1) comprising (I), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB5674 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and (K1) are useful for detecting enterovirus target sequences. (I), (M1) and specifically and selecting enterovirus target sequences. (I) specifically and selecting enterovirus target sequence. (I) specifically and selecting enterovirus target sequences. (I) specifically and selection of broad range of enterovirus senoupes. The present sequence represents a viral 5 untranslated polynucleotide present in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                    ó
                         Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an oligonuclectide (I) consisting of: (a) the target binding sequence of an oligonuclectide chosen from any one of the 10 sequence of AEB56762 to AEB56771; and (b) a sequence required for
                                                                                                                                                                                                                                                                                                                                                                    Gaps

                       (KI) comprising (I), and one or more contains that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving; (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB5676 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of AEBS6772 to AEBS6771; and (b) a sequence required for selected amplification or detection. Also described: (1) a kit (K1) comprising (I), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEBS6764 to AEBS6771 and optionally a sequence required for selected amplification caction; and (b) detecting the amplified target sequence. (I), (M1) and (K1) are useful for detecting enterovirus genome. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral
                                                                                                                                                                                                                                                                                                                                                                              genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56762 to ABB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification to ABB56771 and optionally a sequence required for selected amplification to ABB56771 and optionally a sequence required for selected amplification
genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a consensus viral 5' untranslated polynucleotide sequence given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polymucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel oligonucleotide comprising sequences for binding and amplifying detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               \widehat{\Xi}
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human coxsackievirus B3 5' untranslated polynucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     reaction; and (b) detecting the amplified target sequence. (I), (K1) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome.
                                                                                                                                                                          ;

Also described: (I) at kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (MI) are useful for detecting enterovirus target sequence. (I), (MI) and (MI) and (MI) and (MI) and (MI) are applied target sequence. (II), (MI) and (MI) are applied target sequence. (II), (MI) and (MI) and (MI) and (MI) are applied target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ange of enterovirus serotypes. untranslated polynucleotide
                                                                                                                                                                                                                                                        Human coxsackievirus B3 5' untranslated polynucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sequence given in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ઠે
                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an oligonucleotide (1) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the carget binding sequence of ABBS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS6764 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (M1) and (K1) are useful for detecting enterovirus target sequences. (1) (M1) and specifically and selectively recognizes the enterovirus genome. (1) specifically and selectively recognizes the enterovirus senotypes. The sensitively and rapidly detects fewer than 500 copies of enteroviral sensitively and selection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polymucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                             Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.

The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABBS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS676 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting energy recognizes the enterovirus genome. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral cyneme and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polymucleotide sequence con the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                   ઠે
                                                                                                                                             The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the target binding sequence of ABBS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (II), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS6764 to ABBS6771 and optionally a sequence required for selected amplification reaction, and (b) detecting the amplified target sequence. (I), (M1) and (K1) are useful for detecting enterovirus target sequence. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral contains and analyse detection of broad range of enterovirus fargetypes. The

target binding sequence of an oligonuclectide chosen from any one of the lose of ABBS676 to ABBS671; and (b) a sequence required for selected amplification or detection reaction. Also described. (1) a kit (X1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS670 to ABBS6771 and optionally a sequence required for selected amplification reaction, and (b) detecting enterovirus target sequence. (1), (M1) and (X1) are useful for detecting enterovirus target sequence. (1), (M1) and (X1) are useful for detecting enterovirus target sequences. (1) specifically and selectively recognizes the enterovirus genome. (1) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus recovers. Or present sequence represents a viral S, untranslated polymorlecting enterovirus in the example of a viral S, untranslated polymorlecting enterovirus translated polymorlecting enterovirus translated polymorlecting enterovirus enterovirus enterovirus enterovirus consisting enterovirus than the enterovirus enterovirus than the example of enterovirus enter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ARB56762 to ARB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a wit (K1) comprising (I), and one or more container that contains (I); and (b) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
The invention relates to an oligonucleotide (I) consisting of:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequence given in the exemplification of the present invention

The invention relates to an oligonucleotide (1) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the consequence of ABB56782 to ABB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (M1) and (M1) are useful for detecting enterovirus target sequence. (1) specifically and selecting enterovirus target sequence. (1) specifically and selecting enterovirus target sequence. (1) specifically and selectively recognizes the enterovirus genome. (1) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polymucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                               ö
               to AEB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and (K1) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I) genome and allows detection of broad range of enterovirus genorically and rapidly detects fewer than 500 copies of enteroviral present sequence represents a viral S' untranslated polynuclectide sequence given in the exemplification of the present invention.
consisting essentially of target binding sequence of any one of AEB56764
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  target binding sequence of an oligonucleotide chosen from any one of the los sequence of ABB5672 to ABB5671; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (1), and one or more contains that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving; (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification reaction, and (b) detecting the amplified target sequence. (1), (M1) and specifically and selecting the amplified target sequences. (1), (M1) and specifically and selectively recognizes the enterovirus genome. (1)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       to an oligonucleotide (I) consisting of: (a) the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. present sequence represents a viral 5' untranslated polynucleotide

The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the target binding sequence of ABB56772 to ABB56771; and (b) a sequence required for selected amplification or detection reaction. Also described. (1) a kit (XI) comprising (II), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence of consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequence. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral secretypes. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             5' untranslated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sequence given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 25; DB 14; Length 238; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56762 to ABB5671; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        to AEB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and (K1) are useful for detecting enterovirus target sequences. (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    \Xi
                                                                                                                                                                                                                              Human coxsackievirus A9 5' untranslated polynucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 specifically and selectively recognizes the enterovirus genome.

The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABSS672 to ABSS671; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABSS6764 to ABSS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting enterovirus target sequence. (I), (MI) and (XI) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                    Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sequence given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         100.0%; Score 25; DB 14; Length 238; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of AEB56762 to AEB5671; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) am enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEB56764
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  to AEB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and (K1) are useful for detecting enterovirus target sequences. (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                 Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABBS672 to ABBS6771; and (b) a sequence required for selected amplification or detection. Also described: (1) a kit (X1) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS6764 consisting essentially of target binding sequence of any one of ABBS6764 consisting and Oblicanally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequences. (I) (X1) are useful for detecting enterovirus target sequences. (I) (X1) are useful for detecting enterovirus target sequences. (I) (X1) and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral connect represents a viral 5' untranslated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (I), and one or more contains that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              invention relates to an oligonucleotide (I) consisting of: (a) the

Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               to AEB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and (K1) are useful for detecting enterovirus target sequences. (I)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The
  reaction; and (b) detecting the amplified target sequence. (I), (MI) (XI) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. Present sequence represents a viral 5' untranslated polynuclectide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. present sequence represents a viral 5' untranslated polymucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of AEBS6702 to AEBS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEBS6764 to AEBS671 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I) (MI) and selection and the recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enteroviral
                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.

The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABBS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (I), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS676 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and (K1) are useful for detecting enterovirus target sequence. (I) specifically and selectively recognizes the enterovirus genome. (I) specifically and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5 untranslated polynucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human coxsackievirus B3 5' untranslated polynucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       .

```
target binding sequence of an oligonucleotide chosen from any one of the selected amplification or detection reaction. As degence required for selected amplification or detection reaction. As described: (1) a kit (K1) comprising (1), and one or more contains that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEBS6774 to AEBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (1), (M1) and (K1) are useful for detecting enterovirus target sequences. (1), (M1) and (K1) are useful for detecting enterovirus target sequences. (1), (M1) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (KI) are useful for detecting enterovirus carge, evacuate the useful for detecting enterovirus genome. (I) specifically and selectively recognizes the enterovirus genomially and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The genome and allows detection of variance of enterovirus detection of broad range of enterovirus serotypes. The genome and allows detection of variance invention.
                                                                                                                                                                                                                                                                          Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                  to an oligonuclectide (I) consisting of: (a) the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Coxeackie virus strain VD2921; diabetogenic coxeackie B virus-4; strain VD2921; VP1; VP2; VP4; P2A; P2B; P2C; P3A; P3B; P3C; diabetes; diabetogenic enterovirus; beta cell loss; blindness; renal failure; leg amputation; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB5672 to ABB5671; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (I), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    reaction, and (b) detecting the amplified target sequence. (I), (M1) (K1) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               untranslated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             present sequence represents a viral 5' untranslated polynucleo sequence given in the exemplification of the present invention

The invention describes a polymerase chain reaction (PCR) and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 (CBV-4) strain VD2921, (particularly VP1, VP2, VP3, VP4, P2A, P2B, P2C, P3A, P3B, P3C and P3D nucleic acids). The methods and primers are used for the detection of CBV-4 strain VD2921 which is associated with diabetes detection of chabetogenic enterovirus). Early detection of the diabetes e.g. detection of diabetogenic enteroviral RNA in peripheral mononuclear cells, can improve prognosis by allowing treatment e.g. with antiviral drugs, to prevent further loss of beta cells and severe long term consequences of diabetes including blindness, renal failure and leg amputations. This sequence represents a diabetogenic coxsackie B virus 4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Coxeackie virus strain VD2921; diabetogenic coxeackie B virus-4; CBV-4; strain VD2921; VP1; VP2; VP3; VP4; P2A; P2B; P2C; P3A; P3B; P3C; P3D; diabetes; diabetogenic enterovirus; beta cell loss; blindness; renal failure; leg amputation; ds.

The invention describes a polymerase chain reaction (PCR) and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 (CBV-4) strain vD2921, (particularly VP1, VP2, VP3, VP4, P2A, P2B, P2C, P3A, P3B, P3C and P3D nucleic acids). The methods and primers are used for the detection of CBV-4 strain VD2921 which is associated with diabetes (diabetogenic enterovirus). Early detection of the diabetes e.g.

Polymerase chain reaction and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 strain VD2921.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a polymerase chain reaction (PCR) and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 (CBV-4) strain VD2921, (particularly VP1, VP2, VP3, VP4, P2A, P2B, P2C, P3A, P3B, P3C and P3D nucleic acids). The methods and primers are used for the detection of CBV-4 strain VD2921 which is associated with diabetes (diabetogenic enterovirus). Early detection of the diabetes e.g. detection of diabetogenic enteroviral RNA in peripheral mononuclear cells, can improve prognosis by allowing treatment e.g. with antiviral drugs, to prevent further loss of beta cells and severe long term consequences of diabetes including blindness, renal failure and leg amputations. This sequence represents a diabetogenic coxsackie B virus 4 (CBV-4) strain VD2921 associated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Coxsackie virus strain VD2921; diabetogenic coxsackie B virus-4; CBV-4; strain VD2921; VP1; VP2; VP3; VP4; P2A; P2B; P2C; P3A; P3B; P3C; P3D; diabetes; diabetogenic enterovirus; beta cell loss; blindness; renal failure; leg amputation; ds.
detection of diabetogenic enteroviral RNA in peripheral mononuclear cells, can improve prognosis by allowing treatment e.g. with antiviral drugs, to prevent further loss of beta and severe long term consequences of diabetes including blindness, renal failure and leg amputations. This sequence represents a diabetogenic coxsackie B virus (CBV-4) strain VD2921 associated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polymerase chain reaction and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 strain VD2921.

The invention provides an enterovirus genome (I) for use as a vector or vaccine, modified to produce a virus (VI) having a restricted or altered species or tissue tropism, compared to an equivalent unmodified virus, or modified to produce an attenuated virus (V2), by replacing a part or all of the 5'non-translated region (5'NTR) of (I) with a 5'NTR of an enterovirus genome that encodes VI or V2. (I) is useful as vaccine or vector in targeting genes of interest to specific cells or tissues. (I) is also useful for diagnostic purposes, e.g. to identify virulent, versus nonvirulent strains of an enterovirus. The present sequence represents the 5'NTR (non-translated region) of a non-cardiovirulent enterovirus
                                                                                                                                                                                                                                                                                                                                                                                                                                      Recombinant enterovirus genome for use as vector or vaccine, modified by replacing a part or all of its 5'non-translated region by 5'NTR of enterovirus genome that encodes virus modified in tropism or virulence.
    Coxsackievirus B3 (CVB3)/CO 5' non-translated region (NTR) sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes a polymerase chain reaction (PCR) and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 (CBV-4) strain VD221, (particularly VP1, VP2, VP3, VP4, P2A, P2B, P2C, P3A, P3B, P3C and P3D nucleic acids). The methods and primers are used for the detection of CBV-4 strain VD291 which is associated with diabetes (diabetogenic enterovirus). Early detection of the diabetes e.g. (diabetogenic enteroviral RNA in peripheral monomuclear cells, can improve prognosis by allowing treatment e.g. with antiviral drugs, to prevent further loss of beta cells and severe long term consequences of diabetes including blindness, renal failure and leg

                                                                                                                                                                  The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56762 to ABB56771, and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using fixst amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (MI) are useful for detecting enterovirus target sequences. (I), (MI) and (MI) sequences.
                                                                                                                                                                                                                                                                                                           specifically and selectively recognises the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a coxsackie virus B5 polymuclocide sequence, which is given in the exemplification of the present invention. Note: the present sequence is designated as SEQ ID NO:67 in the Sequence Listing. but corresponds with the sequence given in figure 2 designated SEQ ID
                                                                                                      Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          internal ribosome entry site; cystic fibrosis; cns-gen.;

                                                                                                                                                                                                                                                                                                               The present invention relates to a nucleic acid vector for the expression of at least two cistrons. The vector comprises a promoter operably linked to a nucleotide sequence comprising at least two cistrons and at least one nucleotide sequence comprising an internal ribosome entry site (IRES) selected from Human enterovirus 71 (EV71), Hepatitis C virus (HCV), or Encephalomyocarditis virus (EMCV). The invention also provides a method for screening of anti-viral compounds using the IRES. The invention is useful for the genetic treatment of patients with cystic fibrosis, hemophilia A or B, buchenne or Becker type myopathy, cancer, AIDS and other bacterial or infectious diseases due to a pathogenic organism and
                                                                                   wew nucleic acid vector for the expression of at least two cistrons comprising a nucleotide sequence comprising an internal ribosome entr site (IRES) e.g. enterovirus 71 (EV71), useful for treating a patient having e.g. AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

```
The invention relates to a novel method for detecting and/or quantifying Human metapneumovirus (hMPV) in a sample comprising providing at least one probe or primer specific for a nucleic acid sequence of hMPV, contacting the one probe and/or primer with the sample to allow annealing of the probe and/or primer with the nucleic acid sequence and detecting and/or quantifying the nucleic acid sequence using the annealed probe and/or primer. The method of the invention may be useful for detecting and/or quantifying Human metapneumovirus (hMPV) in a sample. The current sequence is that of the Human coxsackievirus Bl complete genomic DNA of the invention.
                                                                                                                                                                                                  Detecting and/or quantifying human, metapneumovirus (hMPV) in a sample comprises contacting the at least one probe and/or primer with the sample to allow annealing of the probe and/or primer with the nucleic acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention provides an enterovirus genome (1) for use as a vector or vaccine, modified to produce a virus (V1) having a restricted or altered species or tissue tropism, compared to an equivalent unmodified virus, or modified to produce an attenuated virus (V2), by replacing a part or all of the 5'non-translated region (5'NTR) of (1) with a 5'NTR of an enterovirus genome that encodes V1 or V2. (1) is useful as vaccine or vector in targeting genes of interest to specific cells or tissues. (1) is also useful for diagnostic purposes, e.g. to identify virulent, versus nonvirulent strains of an enterovirus. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Recombinant enterovirus genome for use as vector or vaccine, modified by replacing a part or all of its 5'non-translated region by 5'NTR of enterovirus genome that encodes virus modified in tropism or virulence.

Coxsackievirus

Diabetogenic coxsackie B virus 4 (CBV-4) strain VD2921 genome

```
The invention provides a method and a kit for detecting and differentiating an enterovirus type 71 (8771) in a sample. The method involves contacting nucleic acids in the sample with a pair of primers to form an amplification product; contacting the amplification product with at least one synthetic nucleotide sequence fixed on a solid substrate and detecting hybridisation. The present sequence is the enterovirus type 71 (BV71) cDNN.
                                                                                                                                                                                                                                                                                                                                                                                                                                           New kit comprising a pair of oligonucleotide primers for nucleic acid amplification, useful in detecting and differentiating an enterovirus in

```

```
The invention describes a polymerase chain reaction (PCR) and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 (CBV-4) strain VD2921, (particularly VP1, VP2, VP3, VP4, P2A, P2B, P2C, P3A, P3B, P3C and P3D nucleic acids). The methods and primers are used for the detection of CBV-4 strain VD2921 which is associated with diabetes (diabetogenic enterovirus). Early detection of the diabetes e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polymerase chain reaction and primers for detecting nucleic acids from the diabetogenic coxsackie B virus-4 strain VD2921.

These are useful in assays for detecting enterovirus specific antigens, as an indication of enteroviral disease. All 70 serotypes of the enteroviral family can be detected. Diseases such as myocarditis, menin- gitis, encephalitis and pancreatitis can be diagnosed using the Abs. (Updated on 25-MAR-2003 to correct PA field.)

```
The present sequence is that of a coxsackie virus B3 capsid protein VP1 nucleic acid. The invention provides a non-viral vestcle vector for the clivery of nucleic acid to various cardiac cell types. The vestcle vector the cetor contains the hepatitis B virus envelope protein in which at least of a part of the liver targetting sequence is deleted and replaced with a specific cardiac cell targetting sequence. For example, the coxsackie virus B3, VP1 sequence can be used to target the vector to cardiomyocytes. The vesicle vector can be delivered intravenously or intra-arterially rather than by more invasive methods such as direct cardiac injection. It can be used to deliver gene products to replace or enhance expression of proteins for treatment of heart failure, errythmia, reperfusion injury, atherosalerosis, to promote angiogenesis, etc. The vesicles are highly stable and can be produced in large quantities, making them ideal for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             envelope protein with cardiac targeting sequence, and nucleotide sequence for gene therapy useful for treating, e.g., heart failure, arrhythmia and
                                                                                                                                                                                                                                                                                                                                                                                                   hepatitis B virus; cardiovascular disease; heart; antiarrhythmic; antiarteriosclerotic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel non-viral vector comprises vesicular membrane with hepatitis B

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel apparatus for detecting a microbe in a sample which comprises a substrate having multiple microbe identification sites, each having a unique address indicative of the position of that microbe identification site and groups of nucleic acid probes disposed at the microbe identification sites, each group being complementary to a target nucleic acid to provide a detectable signal at one or more microbe identification sites. The apparatus is useful for detecting the presence of one or more microbes in a sample, such as virus or viral particle, (non-)pathogenic bacteria, or cellular or acellular necessarch, epidemiological surveys, and monitoring food contaminants. Current testing procedures or devices, such as radioimmunossays and ELISA, are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          difficult to implement, time consuming, expensive, outdated, and typically rely on the use of agents that recognise and bind to membrane bound proteins or carbohydrates of the pathogen. These further cannot assay multiple pathogens. The new apparatus or device for detecting microbes overcomes these disadvantages. The apparatus is compact, sensitive, and quick to detect the presence of any of a number of pathogens present in a sample. The present sequence is that of an oligonucleotide probe which is related to the microbe detection apparatus
                                                             Novel microbe detection apparatus-related oligonucleotide probe SeqID32.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New (microarray) apparatus comprising a substrate with attached nucleic acid probes, useful for detecting one or more microbes in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

```
sample which comprises a substrate having multiple microbe identification sites, each having a unique address indicative of the position of that microbe identification site on the substrate and groups of nucleic acid probes disposed at the microbe identification sites, each group being complementary to a target nucleic acid to provide a detectable signal at come or more microbe identification sites. The apparatus is useful for detecting the presence of ene or more microbes in a sample, such as virus or viral particle, (non-)pathogenic bacteria, or cellular or acellular microbe. The apparatus is particularly useful for clinical diagnosis, research, epidemiological surveillance, bioterrorism countermeasures, environmental pathogen surveys, and monitoring food contaminants. Current testing procedures or devices, such as radioimmunoassays and ELISA, are difficult to implement, time consuming, expensive, outdated, and typically rely on the use of agents that recognise and bind to membrate bound proteins or carbohydrates of the pathogen. These further cannot assay multiple pathogens. The new apparatus is compact, espathogens present in a sample. The presence of any of a number of an enembrate shathogen present in a sample of any and a number of an enembrate of any and any of an any of an any of an enembrate of all and any of any o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              oligonucleotide probe which is related to the micorbe detection apparatus of the invention.
This invention relates to a novel apparatus for detecting a microbe in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel microbe detection apparatus-related oligonucleotide probe SeqID19.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

```
This invention relates to a novel apparatus for detecting a microbe in a sample which comprises a substrate having multiple microbe identification of that sires, each having a unique address indicative of the position of that microbe identification sites of the position of that probes disposed at the microbe identification sites, each group being complementary to a target nucleic acid to provide a detectable signal at cone or more microbe identification sites. The apparatus is useful for detecting the presence of one or more microbes in a sample, such as virus con virtal particle, (non-)pathogenic bacteria, or cellular or accllular microbe. The apparatus is particularly useful for clinical diagnosis, research, epidemiological surveillance, bioterrorism countermeasures, convironmental pathogen surveys, and monitoring food contaminants. Current testing procedures or devices, such as radioimmunoassays and ELISA, are difficult to implement, time consuming, expensive, outdated, and contaminant or carbohydrates of the pathogen. These further cannot convicting assay multiple pathogens. The new apparatus or device for detecting convictives or carbohydrates of the pathogen. These further cannot casesy multiple pathogens. The new apparatus or device for detecting convictives.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is that of an related to the micorbe detection apparatus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New (microarray) apparatus comprising a substrate with attached nucleic acid probes, useful for detecting one or more microbes in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sensitive, and quick to detect the presence of any of a number of pathogens present in a sample. The present sequence is that of an

Claim 16; SEQ ID NO 17; 89pp; English.

```
This invention relates to a novel apparatus for detecting a microbe in a sample which comprises a substrate having multiple microbe identification sites, each having a unique address indicative of the position of that microbe identification site on the substrate and groups of nucleic acid probes disposed at the microbe identification sites, each group being complementary to a target nucleic acid to provide a detectable signal at one or more microbe identification sites. The apparatus is useful for detecting the presence of one or more microbes in a sample, such as virus or viral particle, (non-)pathogenic bacteria, or cellular or acellular convironmental pathogenic bacteria, bioterrorism countermeasures, research, epidemiological surveillance, bioterrorism countermeasures, environmental pathogen survey, and monitoring food contaminants. Current testing procedures or devices, such as radioimmunoassays and BLISA, are difficult to implement, time consuming, expensive, undated, and typically rely on the use of agents that recognise and bind to membrane bound proteins or carbohydrates of the pathogen. These further cannot a sasay multiple pathogenen. The new apparatus or device for detecting microbes in a sasay multiple and bind disadvantative or device for detecting and procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  microbes overcomes these disadvantages. The apparatus is compact, sensitive, and quick to detect the presence of any of a number of pathogens present in a sample. The present sequence is that of an oligonucleotide probe which is related to the micorbe detection apparatus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel microbe detection apparatus-related oligonucleotide probe SeqID35.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

ADP05512;

microbe detection; microbe identification; virus; viral particle;

ö

```
New (microarray) apparatus comprising a substrate with attached nucleic acid probes, useful for detecting one or more microbes in a sample.
                                                                                                                                                                                                                                                                                                   Claim 16; SEQ ID NO 11; 89pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                        This invention relates to a novel apparatus for detecting a microbe in a sample which comprises a substrate having multiple microbe identification sites, each having a unique address indicative of the position of that microbe identification site and groups of mucleic acid probes disposed at the microbe identification sites, each group being complementary to a target nucleic acid to provide a detectable signal at one or more microbe identification sites. The apparatus is useful for detecting the presence of one or more microbes in a sample, such as virus or viral particle, (non-)pathogenic bacteria, or cellular or acellular necessarch, epidemiological surveys, and monitoring food contaminants. Current testing procedures or devices, and monitoring food contaminants. Current esting procedures or devices, such as radioimmunosasys and ELISA, are esting to the contaminants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              gonucleotide probe which is related to the micorbe detection apparatus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel microbe detection apparatus-related oligonucleotide probe SeqID11.
                                                                                                                                                                                                                                                                                    New (microarray) apparatus comprising a substrate with attached nucleic acid probes, useful for detecting one or more microbes in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      difficult to implement, time consuming, expensive, outdated, and typically rely on the use of agents that recognise and bind to membrane bound proteins or carbohydrates of the pathogen. These further cannot assay multiple pathogens. The new apparatus or device for detecting microbes overcomes these disadvantages. The apparatus is compact.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sensitive, and quick to detect the presence of any of a number of pathogens present in a sample. The present sequence is that of an

```
This invention relates to a novel apparatus for detecting a microbe in a sample which comprises a substrate having multiple microbe identification lites, each having a unique address indicative of the position of that microbe identification site on the substrate and groups of nucleic acid probes disposed at the microbe identification sites, each group being complementary to a target nucleic acid to provide a detectable signal at one or more microbe identification sites. The apparatus is useful for detecting the presence of one or more microbes in a sample, such as virus or viral particle, (non-)pathogenic bacteria, or cellular or acellular microbe. The apparatus is particularly useful for clinical diagnosis, research, epidemiological surveillance, bloterrorism countermeasures, environmental pathogen surveys, and monitoring food contaminants. Current testing procedures or devices, such as radioimunoassays and ELISA, are difficult to implement, time consuming, expensive, outdated, and typically rely on the use of agents that recognise and bind to membrane bound proteins or carbohydrates of the pathogen. These further cannot assay multiple pathogens. The new apparatus is compact, or analysis of a number of an incrobes overcomes these disadvantages. The apparatus is compact, and apparatus is compact, and apparent or an analysis of a number of an analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          igonuclectide probe which is related to the micorbe detection apparatus the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel microbe detection apparatus-related oligonucleotide probe SeqID27.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  oathogens present in a sample. The present sequence is that of an

This invention relates to a novel apparatus for detecting a microbe in a sample which comprises a substrate having multiple microbe identification sites, each having a unique address indicative of the position of that microbe identification site on the substrate and groups of nucleic acid probes disposed at the microbe identification sites, each group being complementary to a target nucleic acid to provide a detectable signal at one or more microbe identification sites. The apparatus is useful for detecting the presence of one or more microbes in a sample, such as virus or viral particle, (non-)pathogenic bacteria, or callular or accillular microbe. The apparatus is particularly useful for clinical diagnosis, research, epidemiological surveillance, bioterrorism countermeasures,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         environmental pathogen surveys, and monitoring food contaminants. Current testing procedures or devices, such as radioimmunoassays and ELISA, are difficult to implement, time consuming, expensive, outdated, and typically rely on the use of agents that recognise and bind to membrane bound proteins or carbohydrates of the pathogen. These further cannot assay multiple pathogens. The new apparatus or device for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 chogens present in a sample. The present sequence is that of an igonucleotide probe which is related to the micorbe detection apparatus
                                                                                                                                                                                                                                                                                                                                                New (microarray) apparatus comprising a substrate with attached nucleic acid probes, useful for detecting one or more microbes in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   overcomes these disadvantages. The apparatus is compact, and quick to detect the presence of any of a number of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 70 BP; 13 A; 20 C; 18 G; 19 T; 0 U; 0 Other;

Viruses

WO2004045365-A2.

```
This invention relates to a novel apparatus for detecting a microbe in a sample which comprises a substrate having multiple microbe identification of states, each having a unique address indicative of the position of that microbe identification site on the substrate and groups of nucleic acid probes disposed at the microbe identification sites, each group being complementary to a target nucleic acid to provide a detectable signal at come or more microbe identification sites. The apparatus is useful for detecting the presence of one or more microbes in a sample, such as virus or viral particle, (non-) pathogenic bacteria, or callular or acellular concore. The apparatus is particularly useful for clinical diagnosis, research, epidemiological surveillance, bioterrorism countermeasures, convironmental pathogen surveys, and monitoring food contaminates. Current testing procedures or devices, such as radioinmunosassay and ELISA, are difficult to implement, time consuming, expensive, outdated, and contaminates or devices, such as radioinmunosassay and ELISA, are difficult to implement, time consuming, expensive, outdated, and contaminates or carbohydrates of the pathogen. These further cannot assay multiple pathogens. The new apparatus or device for detecting microbes overcomes these disadvantages. The apparatus is compact, sensitive, and quick to detect the present eapparatus is compact, or invarior. The invarior paparatus is related to the micorbe detection apparatus
                                                                                                                                                                                                                                                                                                                    New (microarray) apparatus comprising a substrate with attached nucleic acid probes, useful for detecting one or more microbes in a sample.
                                                                                                                                                                                                                                                                                                                                                                                        Claim 16; SEQ ID NO 25; 89pp; English.

                                                                                                                                                                                                       This invention relates to a novel apparatus for detecting a microbe in a sample which comprises a substrate having multiple microbe identification of that acts having a unique address indicative of the position of that microbe identification site on the substrate and groups of nucleic acid probes disposed at the microbe identification sites, each group being complementary to a target nucleic acid to provide a detectable signal at one or more microbe identification sites. The apparatus is useful for detecting the presence of one or more microbes in a sample, such as virus or viral particle, (non-)pathogenic bacteria, or cellular or accllular microbe. The apparatus is particularly useful for clinical diagnosis, research, epidemiological surveillance, bioterrorism countermeasures, convironmental pathogen surveys, and monitoring food contaminants. Current testing procedures or devices, such as radioimmunoassays and ELISA, are difficult to implement, time consuming, expensive, outdated, and contaminants or carbohydrates of the pathogen. These further cannot assay multiple pathogens. The new apparatus or device for detecting microbes overcomes these disadvantages. The apparatus is compact, sensitive, and quick to detect the presence of any of a number of sensitive, and quick to detect the presence of any of a number of sensitive, and quick to detect the presence of any of a number of colligonuleotide probe which is related to the microbe detection apparatus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                            New (microarray) apparatus comprising a substrate with attached nucleic acid probes, useful for detecting one or more microbes in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

target binding sequence of an oligomiclectide chosen from any one of the losequence of ABB5672; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) an kit (XI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB5674 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (XI) are useful for detecting enterovirus target sequence. (I) are useful for detecting enterovirus target sequence. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral consistively and rapidly detects fewer than 500 copies of enteroviral present sequence represents a viral 5' untranslated polymuclectide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                    Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an oligonucleotide (I) consisting of: (a) the

The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB5672 to ABB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (I), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB5674 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and (K1) are useful for detecting enterovirus target sequences. (I), (M1) and (M2) are applied target arget sequences.
                                                                                                                                                                                                                                                                                                                                                      specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The
                                                                                                                                                                                                                                                                                                                                                                                                                                             present sequence represents a viral 5' untranslated polynucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DB 14; Length 117;

Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids. Disclosure; Fig 1A-D; 34pp; English.

The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of AEB56762 to AEB56771; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (XI) comprising (I), and one or more container that contains (I); and detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence

Also described: (1) a kit (K1) comprising (I), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target blinding sequence of any one of ABB56774 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and
                to AEBS6771 and optionally a sequence required for selected amplification seaction; and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide sequence given in the exemplification of the present invention.
essentially of target binding sequence of any one of AEB56764

(1) specifically and selectively recognizes the enterovirus genome. (1) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. Present sequence represents a viral 5' untranslated polynucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the sequence of AEBS6772 to AEBS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEBS670 to AEBS6771 and optionally a sequence required for selected amplification reaction, and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequences. (I) (MI) and selectively recognizes the enterovirus genome. (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sensitively and rapidly detects fewer than 500 copies of enteroviral senome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polymucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.

The invention relates to an oligonuclectide (I) consisting of: (a) the target binding sequence of an oligonuclectide chosen from any one of the target binding sequence of ABBS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEBS676; to AEBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting enterovirus target sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequence. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus the correspondence represents a viral 5, untranslated polymuclectide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

```
target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of AEBS6762 to AEBS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (I), and one or more contains that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEBS6774 to AEBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and (M2) are useful for detecting enterovirus target sequences. (I), (M1) and (M2) are useful for detecting enterovirus target sequences. (I), (M3) and (M3) 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               invention relates to an oligonucleotide (I) consisting of: (a) the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             specifically and selectively recognizes the enterovirus genome. (1) sensitively and rapidly detects fewer than 500 copies of enteroviral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sequence given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   93.6%; Score 23.4; DB 14; Length 236; 96.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 87
           ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     target binding.sequence of an oligonucleotide chosen from any one of the 10 sequence of AEB5672 to AEB56771; and (D) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (I), and one or more container that contains (I); and detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEB56764 to AEB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         specifically and selectively recognizes the enterovirus genome. (1) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polymuclectide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel oligonuclectide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an oligonucleotide (I) consisting of: (a) the

                                                                                                            The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of AEBS6775 to AEBS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (I) a kit (K1) comprising (I), and one or more container that contains (I); and (2) detecting (M1) an enterovitus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of AEBS6764 to AEBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and (M1) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I) specifically and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5, untranslated polymorleotide
                                                                                                                                                                                                                                                                                                                                                                ö
                                                      comprising sequences for binding and amplifying or ful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                               ö

The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56772 to ABB56771; and (b) a sequence required for selected amplification or detection. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification reaction, and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequences. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (K1) comprising (I), and one or more container that contains (I), and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ARBS576 to ARBS5771 and optionally a sequence required for selected amplification reaction, and (b) detecting the amplified target sequence. Also described: (I) a kit (XI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (MI) and (KI) are useful for detecting enterovirus target sequences. (I), (MI) and
               specifically and selectively recognizes the enterovirus general. (1) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serctypes. The present sequence represents a viral 5' untranslated polymucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel oligonucleotide comprising sequences for binding and amplifying detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. present sequence represents a viral 5' untranslated polynucleotide sequence given in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABBS6771; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (K1) comprising (I), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS676 to ABBS6771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequence. (I), (M1) and Specifically and selectively recognizes the entervirus genome. (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.

                                                                                                                                                                                                                                                                                                                                                                                                                                      target binding sequence of an objoint of the chosen from any one of the losequence of ABB5672; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) at kit (K1) comprising (1), and one or more container that contains (1); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB5674 to ABB56771 and optionally a sequence required for selected amplification reaction; and (b) detecting the amplified target sequences. (1), (M1) and (K1) are useful for detecting enterovirus target sequences. (1) specifically and selectively recognizes the enterovirus genome. (1) specifically and selectively recognizes the enterovirus genome. (1) sensitively and rapidly detects fewer than 500 copies of enteroviral common and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5 untranslated polymucleotide sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an oligonucleotide (I) consisting of: (a) the

ö
The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABB56762 to ABB56771; and (b) a sequence required for selected amplification or detection. Also described: (1) a kit (K1) comprising (I), and one or more container that contains (I); and (2) detecting (M1) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 reaction; and (b) detecting the amplified target sequence. (I), (M1) and (K1) are useful for detecting enterovirus target sequences: (I), (M1) and
                                                                                                                                                                                                                                                                                                                                                                                                                      specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The present sequence represents a viral 5' untranslated polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

                                                                                                                                                                                                                                                                                                                                                                                                                          target binding agequence of an observative of the carget binding agequence of an observative of the sequence of ABB5672 to ABB5671; and (b) a sequence required for selected amplification or detection reaction. Also described: (1) a kit (XI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABB56764 to ABB56771 and optionally a sequence required for selected amplification reaction, and (b) detecting the amplified target sequence. (I) (MI) and (XI) are useful for detecting enterovirus target sequence. (I) specifically and selectively recognizes the enterovirus genome. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral companies. Genome and allows detection of broad range of enterovirus processor and present sequence sepresents a viral 5' untranslated polymuclectide sequence given in the exemplification of the present invention.

The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of ABBS6771; and (b) a sequence required for cleated amplification or detection reaction. Also described: (I) a kit (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence using first amplification primer having a sequence consisting essentially of target binding sequence of any one of ABBS6764 to ABBS6771 and optionally a sequence required for selected amplification reaction, and (b) detecting the amplified target sequence. (I) (MI) and (KI) are useful for detecting the amplified target sequence. (I) specifically and selectively recognizes the enterovirus genome. (I) specifically and selection of broad range of enterovirus connectived and allows detecting the amplification of broad range of enterovirus forms and allows detecting the aviral S' untranslated polymuclectide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel oligonucleotide comprising sequences for binding and amplifying or detecting target, useful for detecting enterovirus nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an oligonucleotide (I) consisting of: (a) the target binding sequence of an oligonucleotide chosen from any one of the 10 sequence of AEB56762 to AEB56771; and (b) a sequence required for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                     8
                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                 (KI) comprising (I), and one or more container that contains (I); and (2) detecting (MI) an enterovirus target sequence, involving: (a) amplifying the target sequence, involving: (a) amplifying the target sequence involving sequence consisting essentially of target binding sequence of any one of ABBS6764 to ABBS6771 and optionally a sequence required for selected amplification exaction, and (b) detecting the amplified target sequence. (I), (MI) and specifically and selecting the amplified target sequences. (I) sensitively and rapidly detects fewer than 500 copies of enteroviral sensitively and alplay detects fewer than 500 copies of enteroviral genome and allows detection of broad range of enterovirus serotypes. The sequence given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    quality of an aqueous environmental medium that potentially contains many different microorganisms. A reference set of at least three microorganisms is chosen that, separately or collectively, represent microorganisms is chosen that, separately or collectively, represent microorganisms, or their fragments, in the treated medium is contacted with a set of at least three probes for specific identification and wiltiple determination of selected microorganisms. This determination represents the level of microbiological quality. The method is useful for identifying and quantifying microorganisms in water and provides results that are used to control water purification/production processes. The

cant strains of swine vesicular disease virus (SVDV) used in vaccines prevent swine vesicular disease. Mutant 2

Claim 4; Page; 66pp; English.

(SDVD) gene sequence from the SVDV strain N3. SVDV is the causative agent of swine vesicular disease, which is very similar to foot and mouth disease. The invention relates to the wild-type Taivan Vu-Li strain cDNA sequence, and the gene sequences of the mutant SVDV strains N3, H21 and SP7. The mutant SVDV nucleotide sequence can be used in a vaccine for the prophylaxis of swine vesicular disease. The invention also includes a method for differentiating the mutant SVDV nucleotide sequences from the wild type strain of SVDV, coxsackie virus and foot-and-mouth disease virus through the use of polymerase chain reaction. Note: This sequence This sequence represents the full length Swine vesicular disease virus
